

Two Thumbs Up: New Videos Offer Insight into Vibration

Ludeca Inc., Doral, FL, is offering two new videos on alignment, vibration, and balancing. The first video examines the features and benefits of the Rotalign Ultra shaft alignment system with continuous sweep measurement mode and wireless Bluetooth communication to the sensor. It demonstrates the unique under- and over-constrained alignment centerline capabilities of the Ultra as well as each of the add-on modules available for it. These include the Boralign for measuring the alignment of bore centers in engines, compressors, and pumps; the Levalign for measuring the flatness of machine beds and other surfaces in 3D; and the Straightness module for measuring roll profiles, guide rails, and tracks. The second video sheds light on the Vibxpert two-channel vibration analyzer and the Vibscanner multi-function vibration data collector. Entry-level to advanced multi-point permanently installed online monitoring systems are also shown. Both videos can be watched online or are available on CD by request.
