

Infrared Line Heaters

The LineIR heater series offers the ability to concentrate radiant heat to a long, narrow area for any application that requires a clean, responsive, non-contact heat source. The Model 5194 generates highly concentrated radiant energy along a thin line from 0.08-0.18 in. wide. It can be purchased in various lengths from 2.25 in. for short applications to 38 in. for applications that require a longer length of concentrated heat.
