

## Self-Cleaning Grate in Housing

The self-cleaning Model GH-12 Drawer Grate in Housing is ideal for applications where the process is continuous and cleaning occurs during operation. It combines the extreme strength of Rare Earth magnets into a totally automated self-cleaning system to automatically remove fine tramp iron contamination. Easier, more frequent cleaning prevents excessive buildup on the magnets and assures maximum separating efficiency. Designed to be both economical and convenient, the GH-12 is ideally suited for applications where it would be too costly to shut the system down for cleaning, but tramp metal protection must be guaranteed at all times.
