

Sewage Pump System

The Piranha Low Pressure System offers non-clogging performance and durable and economical installations. Piranha sewage pumps feature a rotating and stationary cutting system, the Contra-Bloc, impeller and specially designed control panel that supplies the pump with a high starting and running torque. These combined features ensure a clog-free operation. The pumps are designed to handle sewage that contains stringy materials such as rags, towels, etc., and are ideal for coastal applications where sewage contains sand and silt.
