

Baghouse Controller

B-PAC Series Dust Collector Diagnostic Controllers seamlessly integrate intelligent filter cleaning, pressure control, particulate monitoring, auxiliary sensing (such as fan amps, temperature, airflow) and a wide range of control functions into a single easy-to-use system that can operate as a standalone controller or networked with existing PLCs and DCS systems. Benefits include reduced maintenance costs, lower compressed air use, energy savings and maximum product recovery. B-PACs are also used as a solution for EPA MACT, Title V and other compliance regulations.
