

Heat Exchangers

Equipped with streamlined Kenics Static Mixer elements, Kenics Heat Exchangers offer maximum transfer rates even with highly viscous, difficult-to-process materials. Used in a wide range of process applications, they require less space, less energy and less time to process than other designs. They provide heat transfer rates of three to seven times greater than conventional empty tubes. Features include: design pressures to 10,000 psi; construction from all metals and alloys; special connections and fittings; x-ray, hydro, dye penetrant and halogen testing.
