

Positive Displacement Pump

The Moyno 1000 positive displacement pump is used in applications from wastewater treatment and chemical metering to pharmaceutical, petroleum and adhesives. It is engineered for trouble-free operation in a variety of services including shear sensitive chemical feeds, adhesives, lime, slurries and viscous crude oil transfer applications. The pin-type universal joint is sealed and lubricated, providing long life and minimum maintenance. A key feature is a two-piece drive shaft that allows easy assembly, maintenance and mechanical seal access. This drive shaft configuration eliminates the need for complete pump disassembly when servicing the mechanical seal.
