## Two-Component Mix-Dispense Valve

The Model 2200-545-037 two-component Miniature Mix-Dispense Valve precisely dispenses miniature beads and very small volumes of low-viscosity pourable materials and abrasive or filled materials. The valve is ideal for low-flow applications typically found in miniature potting, doming, filling and bonding operations. It uses No-Drip technology for dispensing solvent-based, moisture-curing and stringy materials such as epoxies, silicones and polyurethanes in difficult product-assembly applications.
