

Ultrapure Water System

The Milli-Q Advantage system meets the ultrapure water needs of most users and their specific applications. The main benefit is the convenience of a single system. The water quality adapts to the requirements of users in the pharmaceutical, biotechnology, cosmetic, clinical, environmental, food and beverage, and government laboratories. The production unit converts pure water to ultrapure water. Rather than purchasing separate production units, several final point-of-use polishers are available to match the required application. The production units can be placed on the bench, under the bench or on a wall.
