

Filtration/Containment System

Absolut filtration/containment systems contain and remove active compound and toxic product dust during industrial and pharmaceutical production. It can filter extremely fine dust particles and aerosols, bringing pharmaceutical processing contamination levels down well below the most stringent Occupational Exposure Limit (OEL). The system provides a low airborne dust level during handling via the use of two HEPA filters that allow cleaned air to be reintroduced back into the production area with no impact on room-to-hallway air balancing.
