

## Air Demand Analysis

The air demand analysis program uses state-of-the-art data loggers and precision sensors to create a detailed air usage profile for each specific facility. The program monitors and charts air flow, power consumption, system pressures and air quality during normal operating hours over a period of 10 days. Available for systems large and small, this tool creates a complete picture of air requirements including the relationship between peak and base load compressors and each compressor's duty cycle.
