

## Data Collector

VIBXPERT is a lightweight, two-channel, FFT data collector/vibration analyzer for monitoring and diagnosis of machine conditions. As a data collector, the unit records all forms of machine vibrations, bearing conditions, process data and visual inspection information. Collected machinery data is stored on an expandable compact flash card (up to 1 gigabyte) and is transferred to maintenance software for further evaluation, report generation and archiving. The unit also provides comprehensive analysis functionality for the diagnosis of complex vibration problems, with an easy to use icon-driven platform.
