

## Fieldbus Power Supply

The galvanically isolated foundation fieldbus power supply - KLD2-FBPS 1.25.360 - provides 25 V and 360 mA of supply current with minimal heat dissipation, while supporting redundant 24v power. The modules can be mounted adjacent to one another without concern for spacing. They feature a passive design for high reliability, making them an ideal design choice for single segment power needs. The power supplies support the innovative high power trunk method of protection that allows Fieldbus technology users to enjoy the same benefits in terms of power, cable length and number of devices per segment in hazardous locations as they do in general purpose applications.
