

Variable Frequency Drives

The VLT AutomationDrive variable frequency drives are available in the 40-60 HP power range. This power extension covers IP21 and IP55 rated enclosures in the voltage range 380-480/500 V. The drive can handle any specific motor control requirement with a single product platform. This flexibility allows users to take advantage of motor control performance for any industrial process application while keeping costs down. A mass customization manufacturing process enables a new unit to be built and tested within two hours.
