Mass Flowmeter

The insertion style GF90 mass flowmeter's self-cleaning purge ports minimize maintenance requirements and costs in dirty gas applications. By connecting the units's purge ports to compressed air, inert gas or solvent purge lines, process contaminants can be removed regularly and without uninstalling the flow sensor element from the pipe to ensure continuous high accuracy measurement and significantly reduce maintenance activity. The flowmeter utilizes a thermal mass gas flow sensing element designed with 316 stainless steel and nickel-braze construction.
