

Trade Management Software

TradeMaster delivers Internet-based, integrated trade management solutions. Version 4.0 offers integration of authentication login procedures with the active directories (lightweight directory access protocol [LDAP]); automated remote distribution of documentation via e-mail and printout; automated Denied Party List screening down to the name and/or address level for each supply chain participant; support of 64-bit operating systems; and compatibility with both Oracle 10g and Microsoft SQL Server 2005. In addition, the new version implements Microsoft's .NET Framework Version 2.0, yielding asynchronous database operations as well as XML data and large value types.
