

The Heart Of Barracuda Particle-Flow Software Licensing

[CPFD-Software](#) [1] recently selected [Reprise Software](#) [2]'s Reprise License Manager (RLM) as Barracuda® particle-flow software's new license manager. According to the company, RLM's selection for Barracuda represents another example of CPFD responding to customers' requests. CPFD says that some features of the new engineering software include:

- Accurate modeling of fluidized particle flow behavior.
- The flexibility of floating licenses.
- Simple creation of license usage reports to help you optimize usage for increased modeling and faster ROI.
- Increased ease of use.
- The capacity to review multiple design options without construction costs.
- Freedom from node-locked workstations.
- Reduced operating costs of existing processes.

“The integration of RLM not only provides more flexible use of our product, [but it also] will make the development of our future product enhancements easier, such as our new chemical reactions module,” explains Tony Jones, CPFD-Software lead developer. “We’re pleased to have been selected by CPFD-Software,” states Matt Christiano, Reprise Software CEO. “The acceptance of RLM continues to accelerate, and provides more software users a better licensing experience and lower costs.” The company admits that amongst its current Barracuda user list to have their bottom lines positively impacted are Fortune 500® companies in the chemical, petrochemical and power generation markets (plus more).
