

Japan to Launch First Fukushima Investigation

MARI YAMAGUCHI, Associated Press

TOKYO (AP) — Japanese government regulators said Wednesday that for the first time they will conduct their own investigation into the country's nuclear crisis to address key unanswered questions.

The Nuclear Regulation Authority said its investigation into the disaster at the Fukushima-Daichi nuclear plant will be conducted by a panel of outside experts. The probe will start by the end of April and could take decades to complete because parts of the plant, which was decimated by the March 2011 earthquake and tsunami, are still in horrible condition as the complex undergoes a 40-year cleanup process.

The twin disasters destroyed the plant's power and vital cooling systems, causing meltdowns at three of its reactors. Several groups have already published the findings of their own investigations into the crisis, largely blaming the world's worst nuclear disaster since Chernobyl on botched crisis management, government-industry collusion and the tsunami.

But questions remain, and experts still suspect that the quake, not the tsunami, may have triggered the meltdowns. This is a key point that could affect anti-quake measures at nuclear facilities nationwide.

"Nobody has inspected the site very closely and we still have to sort out a lot of technical questions that remain unresolved," said Tetsuo Omura, a regulator in charge of reactor safety. "We have conflicting views, particularly about how the earthquake had impacted key safeguard equipment, a key question that needs to be addressed."

The regulators said the investigation will also look into other issues, including how much and from where radiation leaked at the plant.

The plant suffered an extensive power failure last week after a rat short-circuited an outdoor switchboard, cutting fresh cooling water from four of its seven fuel storage pools for more than a day, a reminder that the fragile complex is running on makeshift equipment and is full of blind spots.
