

## **Our Sustainable Future: Roadmap for preserving the planet**

Submitted by Guest (not verified) on Thu, 06/10/2010 - 6:25am

The United States could completely stop emissions of carbon dioxide from coal-fired electric power plants? A crucial step for controlling global warming? Within 20 years by using technology that already exists or could become commercially available within a decade, scientists are reporting. The scientists outline strategies to make the phase-out possible, including the use of renewable energy and advanced nuclear power plants. Their study appears in ACS' semi-monthly journal Environmental Science and Technology. Intro theme and music by Kevin MacLeod.
