

Manifolds for Filtration

Complete manifolds can be fabricated for multiple water filtration systems to ensure protection of heat exchangers, spray nozzles, pump seals, air compressors, I.E. and R.O. units, and other instrumentation to suit a wide variety of industrial, wastewater, and irrigation applications. They can be equipped with flanged, welded, or Victaulic ends in any size. Each manifold is normally coated inside and out with the same coating used on filter housings but can be coated to meet customer specifications or made of stainless steel. Filters are mounted on the manifold, and the entire system undergoes a hydraulic pressure test to one-and-a-half times design pressure to ensure leak-free performance.
