Multi-Bag Filter for High Flow Rates

The Maxiline MBF HD multi-bag filter housing has been designed for cost-sensitive, high flow rate liquid filtration applications — processes with flow rates up to 4,500 gallons per minute. It features a rugged, hand wheel-operated davit cover. Filter media change-out can be done by removing the cover, loosening the cover eye bolts, turning the hand wheel to raise the cover, and swinging it aside. No overhead cranes or external lifting gear are required. A hydraulic-assist davit cover is available as an option. The filter housing has three-point filter bag hold-downs or bayonet fittings to ensure the seal between each filter bag. The housing body protects against process media by-pass.
