## Sliding Vane Pumps

Cavitation is the main cause of excess noise and added vibration in a pump. LGL and LG Series sliding vane pumps are designed to produce less noise and less vibration than competitive pumps, resulting in longer pump life and reduced costs. Engineered specifically for LPG/NH3 flow applications, they are suitable for applications involving cylinder filling, motor fueling, bulk transfer, vaporizers, bobtails, and transports.

Editor's Note: Patented cavitation suppression liners cushion the effects of collapsing vapor bubbles within the pump, sharply reducing the noise, vibration, and wear normally caused by entrained vapors.
