## **Pulse Jet Filters (2378)**

Pulse jet filters are designed to handle demanding dust collection jobs, have no moving parts to wear out, and come in top- and side-access modular housings. Each is custom engineered for its application and comes outfitted with filter media suited to its operating environment. Dust-laden air or gas enters the unit through a hopper inlet where it is directed toward a deflector that slows the air flow and causes heavier particles to fall directly into the collection hopper. Lighter airborne particles follow the air stream into the dirty air housing where the filter bags are located. The particles collect on the outside surfaces of the filters. The filtered air then flows into the clean air plenum and exits the unit.
