Pump With Patented Air Separation Device

The Model 3500XD, a new medium consistency paper pulp pump with X-Ducer technology, features a patented air separation device. The X-Ducer agitates paper pulp to assist flow into the pump inlet while separating air from the water and fibers. Pump efficiency is said to increase up to 8 points with the X-Ducer, which translates into smaller motor sizes and lower operating costs. The XD design allows pumping of medium consistency pulp up to 10 percent without a vacuum pump further lowering initial capital and operating costs.
