Blender Conveyors

Stationary and portable CB Series blender conveyors combine bulk carrier unloading, transfer, and blending capabilities in one vacuum-pressure unit. They are sized for 5 to 20-plus tph and can handle powdered, granular, or pelletized abrasive materials that are friable. Equipped with automated controls and load cells, the machines blend products from multiple sources and convey them to one or more destinations using a single 15-psig positive-displacement blower. A proprietary semi-dense design results in low line velocities and high material-to-air ratios that reduce wear and product degradation.
