

Custom Flow Tubes

This company manufactures custom flow tubes to customer specifications. The tubes meet exacting industry standards and are tested to ensure that they satisfy requirements for critical flow monitoring. In addition to producing new tubes to specification, the company can develop tooling to reproduce existing flow tubes. Flow measurements are made with digital direct reading flowmeters, and the company has the flow calibration support capabilities to ensure that tubes are calibrated and traceable to NIST standards. Laser micrometers are used to measure accuracy to +20 millionths, and both Statistical Process Control and traditional bench checking are part of the quality assurance procedures that are applied throughout the production process.
