

# Bulk Handling System With Control Options

Bulk material handling systems come with a wide range of customized control options for plants using bulk conveying, weighing, mixing, and distribution equipment. These include controls for individual pieces of equipment through integration for complete plant processes. Software is available for plant managers who want to incorporate process control systems with overall plant operations. Control capabilities range from a basic localized pushbutton, selector switch operation of small processes to plant-wide SCADA (Supervisory Control and Data Acquisition) and DCS (Distributed Control System) systems. Controls are available for weigh scales, mixers, blenders, and distribution-handling equipment.
