

Stay Cool While Granulating

The Vulcanator® from **Franklin Miller** is a specially designed granulator with the ability to reduce whole bales of synthetic or natural rubber into small bits without significant heat rise. According to the company, this unit can drastically reduce dissolving or processing time. A cutting mechanism cuts material to a size fine enough to pass through a special perforated sizing screen, during which the unit's open design minimizes heat rise, reducing or eliminating the need for costly cooling devices.
