

Lift, Rotate & Discharge Drums Without Dust

The MTS hydraulic Lift & Seal System™ from [Material Transfer](#) [1] safely inverts drums containing corrosive, dusty, hygroscopic powders, then meters the materials into an existing process. Dust-tight operation and a clean working environment are achieved by docking the drum to a gasketed pour cone. The system also features:

- A patented Control Link™ rotation system for controlled 180° drum rotation, allowing maximum product discharge.
- A fully integrated volumetric feeder with spherical agitator for even material feeding.
- Contact surfaces made from 316 stainless steel.
- Availability of custom designs to meet application requirements.
