

Discharge Difficult Materials

The FloMaster Circular Bin Discharger from Schenck Process is a compact and totally enclosed positive discharge aid for hoppers and silos where the material to be handled has characteristics that make it difficult to discharge or control. A rotating arch breaker arm travels around the hopper bottom section of the silo breaking any bridge of material which may have formed. This ensures that the flow of material to the discharger is supplied to the single, twin or three stage units offered by Schenck Process for the characteristics of the material to be handled and the throughputs required.
