

Virtual Plant Training

The EYESim™ virtual reality immersive training solution from Invensys Operations Management is now available to help engineers and operators see and safely interact with the plant and the processes they control. Using a stereoscopic headset, trainees enter a computer-generated representation of either a real or proposed process plant where they can quickly absorb and utilize the process data and control system information. The system is designed to:

- Enhance knowledge protection.
- Improve operator performance.
- Provide more realistic and complete training experiences.
- Assist in other asset management and operational activities.
