

# Dissolution Systems with Syringe Filters

Pall Corporation's Acrodisc<sup>®</sup> PSF syringe filters are now included in all SOTAX dissolution systems for solid dosage forms. The syringe filters are used by research and analytical laboratories to help expedite automated sample processing, and feature:

- Improved retention efficiency to help extend HPLC column life by as much as 46 times.
- A multi-layered prefilter which provides two to four times the throughput of standard glass fiber prefilter devices.

The SOTAX dissolution testing systems formulate the drug dosage form and develop quality control specifications for the manufacturing process. Both the SOTAX AT 70smart dissolution systems and SOTAX CTS Content Uniformity test systems will include the Pall Acrodisc PSF syringe filters. Filter refills will be available directly from Pall Life Sciences through its regular sales and distribution channel.
