

# Automated Mixing, Blending & Transfer

Mixing, blending and transfer systems designed, engineered and custom programmed in-house by Tote® Systems provide automatic control for processing and reporting on dispensing, mixing, blending, filling and transport operations. Custom software provides capabilities for controlling a full range of powder handling operations, ensuring that content within each individual bin, bin inverter, blender and discharge station meets the same exacting standards for product integrity, ingredient balance and volume. Other features include:

- Calculation of process time, temperature settings, mixing speeds and product discharge volume.
- An instant quality-control check that automatically assesses and identifies whether the correct ingredient, in the correct amount, has been added.
- Security controls that limit access by a particular operator.
