

Collect Data over a Cellular Network

According to TandD, the RTR-500GSM mobile base station offers unprecedented flexibility for monitoring and collecting data from virtually anywhere. By connecting T&D's new line of wireless data loggers through a cellular network, the system allows for monitoring from remote or mobile operating environments. The mobile base station:

- Can be configured to automatically “push” current readings and recorded data to cell phones, PCs and servers through a variety of means, such as E-Mail, SMS or FTP.
- Can send warning messages if preset limits are exceeded.
- Has an optional GPS Receiver that allows current readings from Remote Unit(s) can be sent via e-mail or FTP along with current location info attached.
