

Standard- & Heavy-Duty Clamps

Brennan Industries Inc. recently introduced a line of standard- and heavy-duty clamps. The clamps are available in steel and stainless steel, and offer a vibration-dampening, four-rib design that prevents loosening of joints and welds. Standard-duty clamps are designed for average loading and light vibration applications such as machine and tool applications, and instrumentation tubing. Heavy-duty clamps are designed for heavier pipe and higher vibration applications, and come in weld-plate and channel-mounting designs. Other features include:

- Various mounting forms for compact and efficient plumbing where the installation has multiple lines stacked vertically or horizontally.
- Compatibility with pipe sizes up to two inches for the standard-duty clamps and up to 8 inches for the heavy-duty clamps.
