Remove Water from Diesel Fuel & Hydraulic Oils

The Trans-O-Filter unit from

SERFILCO re-circulates at flow rates of 3 to 10 GPM on fuel or hydraulic systems to collect entrained moisture on a coalescing element until water droplets form large enough to drop to the sump for easy removal from a draw-off drain valve. The Trans-O-Filter additionally grants:

- The flexibility to select high dirt-holding capacity depth cartridges or absolute media of pleated membrane to trap 1-micron particles.
- The ability to add of a pre-filter to remove particulates and enhance the life of the coalescing element.
