

# Large-Character Ink Jet Printers

Videojet Technologies has enhanced its Videojet® 2300 Series ink jet printers — the industry's only large-character, high-resolution ink jet printers to recycle and reuse ink used during automatic printhead micropurge. The company says that its 2340, 2350 and 2360 Series printers all incorporate:

- Automatic printhead micropurge for the printheads during operation, helping to eliminate frequent downtime, while maintaining high-quality printing, even in dusty environments.
- The flexibility to print text, logos and GS1-compliant bar codes up to 2.7 inches to meet a variety of case-coding needs.
- Optimal code quality.
- The reduction of inventory expense by eliminating the need for pre-printed cases.
- A molded, rounded front plate to protect the printhead from impact with boxes on the line, ensuring consistent print quality in secondary packaging applications.
- Claricom CLARiSOFT™ message management software that supports message creation using alphanumeric codes, graphics, images and bar codes.
- The ability to print variable information onto cases online.
- The power to link up to 4 printers into a single print system with full system control and job selection possible from the interface of the master printer
