

Mills that Produce Nano-Sized Particles

NETZSCH offers two technologies that can accomplish the difficult task of producing Nano-sized particles. According to the company, the right equipment is essential for wet processing, and Zeta Mills are the preferred solution. Additionally:

- A complete MiniCer will be displayed at PTXi to spotlight this technology.
- In dry processing, only the new s-Jet Steam Jet Mill can efficiently produce nano-sized particles.
- Based on the company's successful fluidized bed jet mill technology, the s-Jet is represented by a CGS 10 cutaway.
