

Software for Digital Printing

iSys Label's new variable data software iSys Variable Data Printing (iVDP) Version 2.2.0.0 is a full-featured, easy-to-use software package developed for Company's short- to mid-run digital label printers, the APEX 1290 and EDGE 850. The software provides the user the ability to combine static and dynamic content to create varying multi-graphic labels containing variable text, images and barcodes. Layouts can easily be set up and configured to run variable portions in both horizontal and vertical dataset formats, enabling the users to quickly create highly-targeted, professional designs. Included is a pre-adjust color registration app and memory management system. This means that even large jobs exceeding the printer's capacity will run without data loss.
