

Temperature & Humidity Data Logger

The HOBO UX100 Series family of data loggers from Onset Computer Corporation tracks temperature and relative humidity in indoor environments. The series offers high accuracy, large measurement capacity and a wealth of LCD display features. The matchbox-sized loggers quickly and easily collect indoor environmental data in a broad range of applications. This includes monitoring comfort in office buildings, tracking food storage conditions in warehouses and logging temperature trends in server rooms. The series features an easy-to-view LCD display that visually confirms logger operation and battery status, eliminating the need to connect the logger to a PC to see the information. Once data has been recorded, it can easily be viewed in graph form and analyzed using Company's HOBOWare® Pro software.
