

Traceability Software

The Specialized Inventory Management with Barcode Accuracy (SIMBA) Lite 2012 from Dynamic Systems, Inc. is designed to provide food processors with the ability to process, label and track their products from "field or dock to customer."

- Designed for companies that process in bulk (similar or same products into constant weight cartons)
- Allows a production line worker to change content of product labels with a fingertip on the computer or touch screen, capturing product information (weight, size, color, grade) and printing a label with a barcode identifier for that tote or carton
- Label information is stored in the unit's inventory system, which then provides production and inventory reports
- Cartons may then be accumulated onto a pallet and tracked with a single pallet identifier
- Integrated system gives the user complete traceability of the product from receiving to shipping
- Cartons or pallets can be stored and tracked by location within the warehouse, cooler or freezer
- At the time of shipping, the Van Loading feature tracks each carton or pallet onto a specific van
- A Bill of Lading is then produced automatically
