

Can Drying Tunnels

Air Control Industries' DRI-Line series can drying tunnels use a variable height plenum with a Y shaped slot configuration and have been specifically designed for drying the tops and bottoms of cans. The tunnels can be readily supplied to cater to single or multi lane conveyors.

- Rest on brackets attached to the conveyor
- Feature specifically configured slots that direct air to remove the water efficiently while driving it downwards and out of the enclosed area
- Enclosed environment ensures the dispelled water is contained
- The drying air performs more effectively than with conventional "open" alternatives
