

Visual IR Thermometer

Fluke Corporation introduces the Fluke VT04 Visual IR Thermometer, a troubleshooting tool for electrical, industrial maintenance, HVAC/R, and automotive

applications. The thermometer features a built-in digital camera, built-in intelligence so issues can be detected with no training required, and thermal heat map overlay. It displays and saves images as full digital, full infrared, or in three blended modes to the included micro-SD card, eliminating the need to write down single or multiple measurements. This model also advanced alarm features for troubleshooting stubborn intermittent issues, including a hi-lo temperature alarm that flashes on the screen if the user-selected temperature goes out of the selected range, a time-lapse image capture that can be set to capture images in 30-second to one-hour intervals and an auto-monitor alarm that initiates image capture automatically after a temperature alarm has been triggered, allowing users to automatically capture images — even while unattended — using the universal tripod mount.
