

## Extreme Condition Cables

New High Durability Cables from Balluff help prevent downtime and replacement for

physical, washdown, temperature and weld slag situations. These silicone, silicone tubed, and PTFE cables resist hot weld sparks, as well as prevent build-up over time that could cause shorts and failures to the cables. The stainless steel braid and flexible conduit versions are abrasion and crush resistant to prevent physical cable abuse. ECOLAB and IP69K rated cable versions, with stainless hex nuts, are caustic and washdown resistant, able to resist chemicals eating through cable jackets and high pressure washing destroying components. The fiberglass jacket and thermoplast versions prevent high temperature melting and premature aging of cable material.
