

Media Containment Device

Flo-Tite's Media Containment Device is an environmentally safe solution to the problem of valve leakage, especially in applications involving

hazardous materials. The media containment unit is basically a duplicate valve-stem seal system, which can be added to the valve when purchased, or kept in stock for when a valve stem leak is detected, eliminating the need for process shut-downs and/or emergency personnel evacuations. A managed course of action can then be taken during routine process maintenance.
