

# Ductless Chemical Workstation

The Mystaire FE-2620 ductless economy chemical workstation provides a high level

of operator protection while performing routine laboratory manipulations with liquid chemicals or powders. The workstation recirculates the filtered air inside the laboratory space while removing potentially harmful toxins from the airstream. Typical applications for the unit are histology, powder weighing and manipulation, cleaning of parts and glassware, sample preparation, solvent mixing and pouring. The workstation can easily be positioned over a laboratory sink, or placed directly on a laboratory counter or bench top. It is designed to establish negative pressure at the opening to allow contaminants to be pulled into the filtration zone. A wide variety of activated, chemisorptive and specialty carbon blends as well as HEPA and ULPA filtration materials are available to meet specific application needs.
