

Membrane Nitrogen Generators

Atlas Copco Compressors introduces a new on-site nitrogen generator that

integrates with existing compressed air installations and eliminates the operational and administrative costs associated with purchasing, transporting and storing bulk liquid supplies of gas. The new membrane nitrogen generator (NGM) incorporates a bundle of polymer fibers that acts as a membrane to separate compressed air and produce enriched nitrogen. The technology generates nitrogen with adjustable purity levels and flows up to 7400 scfh. The NGM is suitable for many blanketing and product transfer, oil and gas, mining and marine applications.
