

## X-Ray Inspection System

The new Mettler-Toledo Safeline PipeChek X-ray inspection system was designed specifically to meet the high-speed inspection needs of

processors of liquid, slurry and solid products. Inspecting pumped products and rejecting contaminated material prior to value-adding operations and packaging significantly reduces production costs. Using low-energy x-ray technology, the system reliably detects and rejects contaminants such as metal and bone. With a 6-inch full color touch screen user interface and intuitive software, the design makes operation simple, requiring no specialized x-ray knowledge. The system is designed specifically for operation in harsh environments in food processing facilities, and is designed for convenient and thorough sanitation. The system can be quickly disassembled for cleaning, cleaned and reassembled in minutes, maximizing the availability of the system for production.
